FIFTH EDITION

$25

This Master Reference Directory results from more than six years research, extensive correspondence, and thousands of hours in the field verifying information. Most importantly, it is the product of continuing encouragement from system managers and insiders who have provided generous assistance and first hand knowledge of the systems they work with daily. Thank you sincerely to callers and writers who stimulate me to carry out this fascinating obsession with the electromagnetic spectrum.

All material presented herein is commonly known and not sensitive. Listings are arranged to show the infrastructure of government agencies and how they relate to each other using mobile radio for communication interoperability. The FCC has allocated the frequencies shown on page 360 specifically for this purpose and the function for each channel is yet to be determined in regional plans being drawn up at this writing.

Our cover photo this year is Monument Peak near Milpitas. Appropriate graphics have once again been provided by the deftness of my colleague Ed "ET" Tobiasz.

LISTING METHOD

Notation	Function	Name	F	Input	Output	Tone
Countywide	Patrol primary	red	1	155.730	159.090	146.2
	Mount Toro					
	Williams Hill					
	Patrol secondary	white	2	155.595	158.910	146.2

Repeater inputs are given for reference only
Repeater locations for large systems are shown in many cases.

TONE CODES	146.2	continuous tone squelch code
	D162	digital tone squelch code

FIFTH EDITION

MOBILE RADIO RESOURCES

2661 CAROL DRIVE
SAN JOSE CA 95125
408 292 4342

THANK YOU for the order for Government Radio Systems - CA 5th Edition 1988. I know you will find this latest edition the most comprehensive reference directory ever compiled on the subject and hope it will be useful in your work.

Many persons contributed information and encouragement to make the book accurate. Each verbal, telephonic, postal, and document input is carefully reviewed and verified so that they accurately compliment existing information, describe changes, or correct errors that may have crept in.

In this edition, a substantial amount of unit numbering material has been added to help the user appreciate whos-who on the air. To detail much further would be burdening and diffuse the main theme. Yet many including myself take pleasure working on numbering systems and systematically compiling large files using computerized spread sheets containing loggings of every unit heard on systems of interest. It is a fascinating aspect of our communication obsession that shows organized numerical mosaics.

The editing process for this book is complex yet routine. Input is gathered, sorted, and compiled to show how individual and related systems are organized to support the user's function. Wherever possible, I try to contain similar material on a single page such as a Sheriff or Fire Department system. A great amount of research and verification using various sources and methods is completed to prevent errors or deliberate false insertions. So far, I have identified none of the latter. However in our deregulated communication environment there are a few systems with expired licenses, no licenses, or are functionally different than commonly thought. All are appropriately shown in listings as determined by monitoring.

The last 72 pages of this directory describe federal VHF/UHF systems from Agriculture to Treasury, a challenging task to compile because no comprehensive source document exists. From an Interdepartmental Radio Advisory Committee (IRAC) microfiche from the Commerce Department, through usual field input sources including agency representatives, and ending at the editor's computer, information was compiled to produce the final result. In some cases, new frequency reports were analyzed and compared to other assignments, a process that reveals block allocations to particular departments. Anomalies and unexplained reports appeared during editing but by diligent methodical teamwork an intricate pattern emerges. The law enforcement material was provided by federal agents who broadcast the information into our homes for compiling by processes described herein. As such, none is sensitive.

My sincere thanks to those who call, write, and share to make Government Radio Systems accurate. No call goes unreturned, no letter unanswered. To credit all here would be burdensome.

I took your suggestions this edition and provided drilling for binder insertion (except in the first 70 that were expedited for promotion). Edge thumb indexes to locate county, state, and federal sections serve as additional convenience. I am still evaluating titled executive binders, unbound drilled packets, and IBM-PC compatible diskette editions.

Pleasant Listening

ABOUT TONE CODES

Subaudible tone squelch provides a method to guard receivers in a system on a channel shared with other users from the annoyance of hearing each other. By using multiple tone on a system employing more than one repeater (mobile relay), the mobile operator chooses the desired repeater for his communication and monitors a common tone which all repeaters transmit. Channel Guard, Quiet Channel, and Private Line are trade names given to the tone guard option in mobile radio equipment sold by various manufacturers.
This directory lists continuous and digital tone squelch codes for system designers and enthusiasts information.
